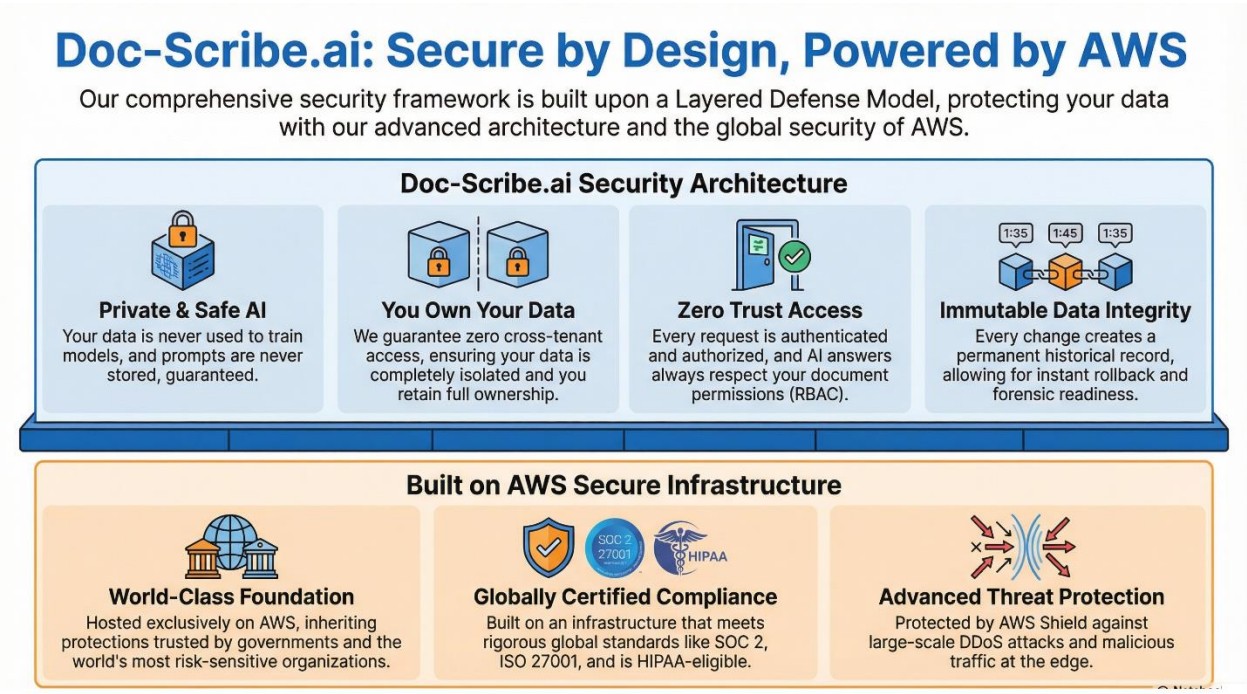
Doc-Scribe.ai Security Architecture & Compliance Whitepaper

1. Executive Summary: Commitment to Data Trust

At Doc-Scribe.ai, security and trust are not features, they are the foundational principles of our Digital Management System (DMS). We understand that the integrity, confidentiality, and availability of your documents are paramount. Our comprehensive security framework is built upon a **Layered Defense Model**, leveraging the global security compliance of **Amazon Web Services (AWS)** and integrating proprietary security architecture to protect data across all stages of its lifecycle.

2. Secure Infrastructure: The AWS Foundation

Doc-Scribe.ai is hosted exclusively on Amazon Web Services (AWS), the industry leader in cloud infrastructure. This partnership allows us to inherit a globally-validated security foundation designed to meet the rigorous requirements of the world's most risk-sensitive organizations.



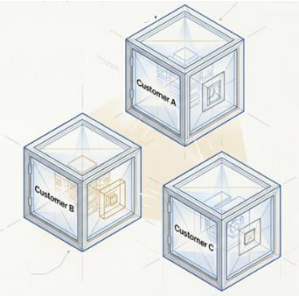
Our security posture is optimally managed by adhering to the AWS Shared Responsibility Model:

- **Security of the Cloud (AWS Responsibility):** AWS manages the security of the underlying infrastructure, including data centers, networking hardware, and the virtualization layer. This infrastructure is attested by major compliance standards, including **SOC 1/2/3, ISO 27001, HIPAA-eligibility, and PCI DSS Level 1.**

- **Security in the Cloud (Doc-Scribe.ai Responsibility):** Doc-Scribe.ai is responsible for the application layer security, guest operating systems, platform configuration, and customer data protection. Our ***serverless*** architecture is secured using **AWS Firecracker micro-VM isolation**, ensuring every process executes within a secure, hardware-virtualized sandbox.

3. Data Governance and Confidentiality

3.1 Strict Tenant Isolation and Data Ownership



Customer Data is Sacred. You maintain full and exclusive ownership of all documents and associated metadata uploaded to the Doc-Scribe.ai platform.

- **Zero Cross-Tenant Visibility:** Our platform utilizes native AWS isolation controls. Your organization's data is logically, physically, and computationally separated from all other customers at both the storage and compute

levels, guaranteeing absolute **Strict Tenant Isolation**.

3.2 Advanced Authentication and Session Integrity

We employ state-of-the-art cryptographic protocols to manage access and sessions securely.

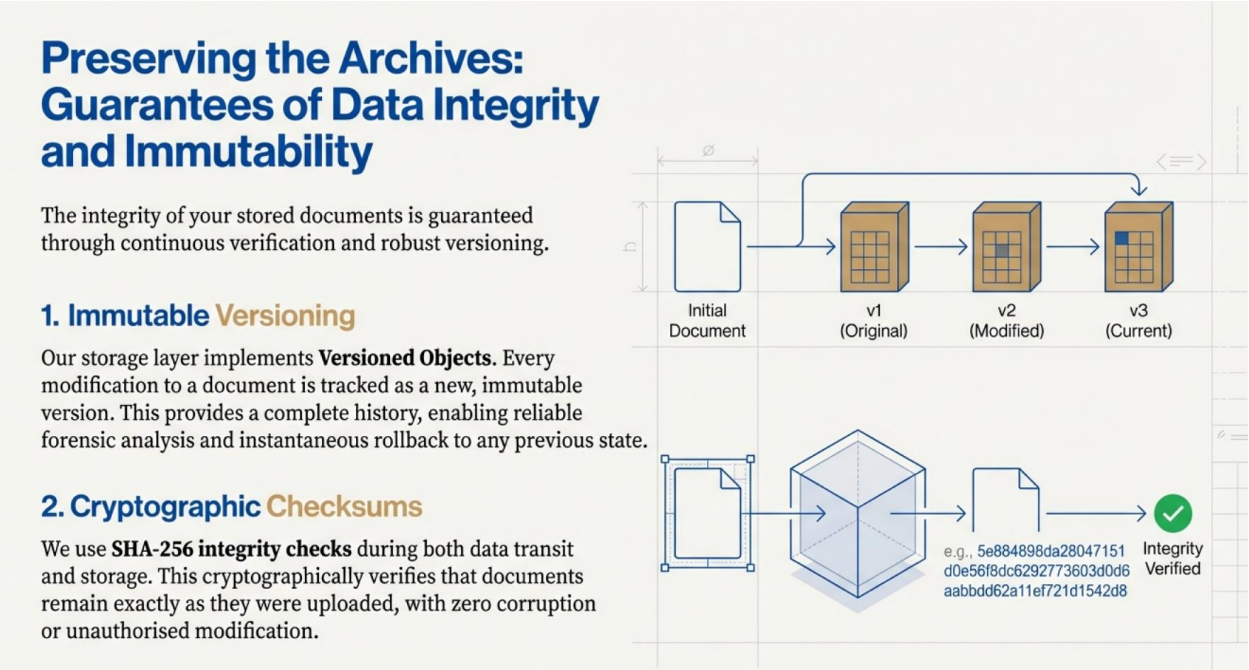
- **Secure Remote Password (SRP) Protocol:** Used for primary authentication, SRP ensures your password is never transmitted across the network, even in an encrypted state. It relies on a zero-knowledge proof to verify identity, providing robust defense against "Man-in-the-Middle" and replay attacks.

- **JWT-Based Session Security:** Upon successful login, users are issued **short-lived, cryptographically signed JSON Web Tokens (JWT)**. These tokens are subject to automatic rotation and validated on every request to maintain continuous session integrity and minimize exposure risk.

- **Multi-Factor Authentication (MFA):** Enterprise-grade MFA is fully supported, establishing an essential second layer of defense beyond traditional passwords.

3.3 Data Integrity and Immutability

The integrity of stored data is guaranteed through continuous verification and robust versioning.



4. Enterprise-Grade AI Safety and Privacy

Our integrated AI features are designed to be enterprise-safe, utilizing **Amazon Bedrock** to address critical business privacy concerns. The "No-Training" & "Zero-Persistence" Guarantee

Doc-Scribe.ai provides a contractually binding guarantee that your data is never used for training models.

- **No Data Usage for Training:** Amazon Bedrock assures that your input prompts and AI-generated completions are **not** used to train or improve any underlying foundational models. Data is never shared with third-party model providers.

- **Zero-Persistence Guarantee:** All prompts and AI responses are **ephemeral**. They are not logged or retained by the underlying AI infrastructure for model improvement or any other permanent storage purpose.

- **Private Knowledge Base:** Your documents are indexed into a dedicated, isolated knowledge base, specifically for your organization. This index is secured with the identical **AWS-grade security controls** protecting your primary document store.

5. Network Architecture and Access ControlZero Trust and DDoS Protection

We implement a rigorous **Zero Trust Architecture** where every user and every request is considered untrusted until proven otherwise.

- **Role-Based Access Control (RBAC):** Access to AI and search results is strictly governed by the **document-level permissions** you assign to your users, ensuring that only authorized individuals can view or interact with specific data.

- **Identity Protocols:** Every request is authenticated and authorized using enterprise-standard identity protocols (**OIDC/SAML**).

- **Global DDoS Protection:** We utilize **AWS Shield** and advanced edge security services to provide comprehensive protection against malicious traffic and Distributed Denial of Service (DDoS) attacks.

6. Compliance and Auditability

Our security controls are validated and auditable, aligning with international regulatory requirements.

- **Global Compliance Framework:** Doc-Scribe.ai operates within an audited environment that meets the world's most rigorous compliance standards, including **GDPR, SOC 2 Type II, ISO 27001, and HIPAA-eligibility.**

- **Immutable Audit Trails:** Every action performed within your environment is logged to immutable **AWS CloudTrail and CloudWatch logs**, providing a comprehensive and tamper-proof record essential for your compliance and forensic review.

7. Resources and Contact Information

For official technical verification of the security guarantees provided by our infrastructure partner, please refer to the following resources:

- **AWS Cloud Security Foundation:** https://aws.amazon.com/security/
- **Amazon Bedrock Data Privacy & Security:** https://aws.amazon.com/bedrock/security-compliance/
- **AWS Compliance Programs:** https://aws.amazon.com/compliance/programs/
